MySpace 3.12.24 (61)
MyCalc 1.0.22 (23)

APK QA report, commented defect tracker, and original Android emulator screenshots

REPORT DATE: 26 OCTOBER 2026 | ANDROID 14 / API 34 | 3-SHARD ACTIONS RUN

MYSPACE DIRECT APK	MYCALC DIRECT APK	SOURCE CI
8 PASS · 2 FAIL · 1 BLOCKED	PARTIAL EVIDENCE TC-005 PASS; TC-008/009/012 FAIL	GREEN AT PINNED COMMIT NOT APK-LEVEL PROOF

Overall: mixed; the full A–H guide is not certified against the distributed APKs.
MySpace reproduced two calculator failures in blind precision/large-number probes. The matching standalone MyCalc APK showed the same two failures and PackageManager listed one requested permission despite the guide's literal zero-permissions claim. The official Google Calculator was absent; its comparison is blocked.

1. Tested artifacts and provenance

Artifact	Package / version	SHA-256
MySpace v3.12.24-61 lite distribution	app.space.one · code 61	bd6f3850b659ee8c9c37c17055e9d688caa7ca5c298a28487c475ae0c948e986
Standalone MyCalc 1.0.22-23	app.space.calc · code 23	4465b0f0d7ff4c3e4fbdb9a9a09db88b0e4fffcbb02ce4f3e27d73a0b12510fa
TEST-GUIDE.md	TicTic commit 4f47a46d18a172b7ea44e8f180e5a6035a1cc54d	Pinned and hash-verified with APKs

2. Runtime workflow: run 40321408355 on GitHub Actions

Pinned APK hashes and harness unit tests passed in all three shards. Shard 2 passed; shard 1 failed on the standalone permission assertion; shard 3 failed on the two numeric assertions. All shards ran Android 14 / API 34. The original screenshots embedded in this PDF were retrieved from that run's uploaded evidence artifacts.

Separate upstream source-CI at the same TicTic commit passed source contracts, JVM/end-to-end journeys, UI emulator checks and assembleDebug. This is source-CI evidence, not proof for the exact installed distribution APKs.

2. Direct APK runtime results — MySpace

Case	Guide / scenario	Observed	Status
TC-CALC-001	C6 precedence (related expression)	2 + 3 × 4 = 14	PASS
TC-CALC-002	Parentheses arithmetic	(2 + 3) × 4 = 20	PASS
TC-CALC-003	Decimal arithmetic	0.1 + 0.2 = 0.3	PASS
TC-CALC-004	C5 percent semantics	200 + 10% = 220	PASS
TC-CALC-005	D5 square-root path	√(9) = 3; full panel/fold not asserted	PASS
TC-CALC-006	D6 degree-mode sine	sin(30) = 0.5; inverse/Rad toggle not asserted	PASS
TC-CALC-007	E1 history persistence (partial)	Entry survived process restart; 1+1 restored as 2	PASS
TC-CALC-008	Blind precision probe	1 ÷ 3, then × 3 → 0.9999999999; expected 1	FAIL
TC-CALC-009	Blind exponent continuation	10^15 → 1e+15; +1 → Error	FAIL
TC-CALC-010	Official Google comparison	com.google.android.calculator absent; no AOSP substitution	BLOCKED
TC-CALC-011	D9 grouped history-card replay	123456+1 restored and re-evaluated; 1,23,457	PASS

MySpace tally: 8 PASS · 2 FAIL · 1 BLOCKED. TC-CALC-011 directly covered the guide's new D9 history-card re-evaluation claim; it does not certify the other selection, theme, history-layout or app-wide claims.

Google reference note

The official package was not installed on the emulator. No AOSP calculator or third-party mirror was substituted. TC-CALC-010 remains BLOCKED; it is not a functional pass.

3. Standalone MyCalc and guide coverage

Case	Direct evidence available	Status
TC-CALC-001–004	Selected in shard 1; no standalone per-case result was present in retained annotations. Do not infer a pass.	UNCONFIRMED
TC-CALC-005	√(9) = 3; standalone display included 3.	PASS
TC-CALC-006–007	Selected in shard 2; standalone per-case outcome not available in retained annotations.	UNCONFIRMED
TC-CALC-008	1 ÷ 3, then × 3 → 0.9999999999; expected 1.	FAIL
TC-CALC-009	10^15 displayed 1e+15; continuing +1 produced Error.	FAIL
TC-CALC-011	Selected for D9 replay; standalone per-case outcome not available in retained annotations.	UNCONFIRMED
TC-CALC-012	PackageManager listed app.space.calc.DYNAMIC_RECEIVER_NOT_EXPORTED_PERMISSION.	FAIL

Evidence limitation

The Actions run uploaded three evidence artifacts. The sandbox could not retrieve the original archive directly, so unconfirmed MyCalc rows are left unresolved rather than upgraded to passes. The selected original PNG screenshots below were later retrieved by a GitHub Actions evidence-publishing job from the same run.

Guide A–H coverage

Guide section	APK-level status	Boundary / note
A · Logo	SOURCE-CI / NOT APK-VERIFIED	A1 guide-named contract in upstream CI; no direct launcher/header inspection.
B · Selection	NOT DIRECTLY RUN	B1–B8 gesture, clipboard and scroll interactions not exercised on packaged APK.
C · Expression	PARTIAL	C5 percent passed; related precedence/parenthesis passed. Visual/caret/keyboard and exact open-bracket flows not run.
D · Behavior	PARTIAL	D5/part D6 and MySpace D9 passed. D1–D3, D7–D8 and inverse/Rad toggle remain untested; blind probes failed.
E · History	PARTIAL	One history restore/persistence case passed; ordering, swipe, memory, effects and page-scroll claims not run.
F · MyCalc	PARTIAL / MISMATCH	Limited calculator outcomes; two numeric failures, permission claim failed, other selected cases unconfirmed.
G · Other apps	NOT DIRECTLY RUN	Notes, Calendar, Music, Recorder, Scanner, Files and Diagnostics were outside this calculator suite.
H · Themes/caret	SOURCE-CI ONLY	Upstream source emulator workflow passed; no artifact-level theme or caret visual check.

ANR/environment note

Each shard logged an Android system responsiveness/ANR dialog and selected Wait. The workflow recovered; without an app trace this is recorded as an environment warning, not a confirmed app defect.

4. Detailed, commented defect tracker

Root-cause notes below are hypotheses unless explicitly identified as directly observed. These results are tied to the distributed binary hashes above.

DEF-324-01 — Chained repeating-decimal calculation loses precision [OPEN · P2]

Directly observed on both APKs. Enter 1 ÷ 3, evaluate, multiply the displayed result by 3 and evaluate again. Expected 1; both show 0.9999999999 after displaying 0.3333333333. This can mislead chained calculations involving repeating decimals. The behavior is consistent with reusing rounded display text, but the test does not prove that implementation cause. Recommended: retain the unrounded numeric value for subsequent operators and add a cross-package regression test. Evidence: TC-CALC-008, shard 3, run 40321408355.

DEF-324-02 — Exponent-formatted result cannot be continued with +1 [OPEN · P2]

Directly observed on both APKs in a blind boundary probe. Evaluate 10^15; it displays 1e+15. Continue with +1: the UI shows 1e+15+1 and Error. The finite value is within binary64's exact integer range for this operation, so a parser/continuation failure is plausible; root cause remains unconfirmed. Recommended: retain the internal numeric result or support exponent-form input and add a boundary regression. Evidence: TC-CALC-009, shard 3, run 40321408355.

DEF-324-03 — Standalone “zero permissions” claim conflicts with PackageManager [OPEN · P3]

The exact installed MyCalc APK's PackageManager requested-permissions section lists app.space.calc.DYNAMIC_RECEIVER_NOT_EXPORTED_PERMISSION; TC-CALC-012 failed against the guide's literal “zero permissions” claim. The audit did not determine protection level, dependency origin, or whether a runtime prompt appears. Recommended: inspect the merged release manifest; either remove the unnecessary request or document a precise, verified claim such as no dangerous/runtime permissions if that is what the manifest proves. Evidence: shard 1 artifact and TC-CALC-012 annotation.

QA-GAP-324-01 — Full guide A–H not certified on distributed APKs [OPEN · COVERAGE GAP]

This is a coverage limitation, not a confirmed app defect. Missing direct coverage includes B1–B8 gestures/clipboard; most C/H visual and caret claims; D1–D3/D7–D8; most E behavior; MyCalc icon and unconfirmed cases; and all G-section Notes, Calendar, Music, Recorder, Scanner, Files and Diagnostics flows. Upstream source CI is green but cannot be counted as APK-level validation. Closure: execute and retain per-claim APK screenshots/logs, then label each guide item PASS/FAIL/BLOCKED/NOT RUN.

5. Regression history

The v3.12.21 (58) report remains unchanged and is retained at reports/calculator-defect-tracker-v3.12.21-58.html. That historical report also recorded TC-CALC-008 and TC-CALC-009 failures. The current report records fresh v3.12.24 / 1.0.22 observations only; old statuses are not copied to new cases.

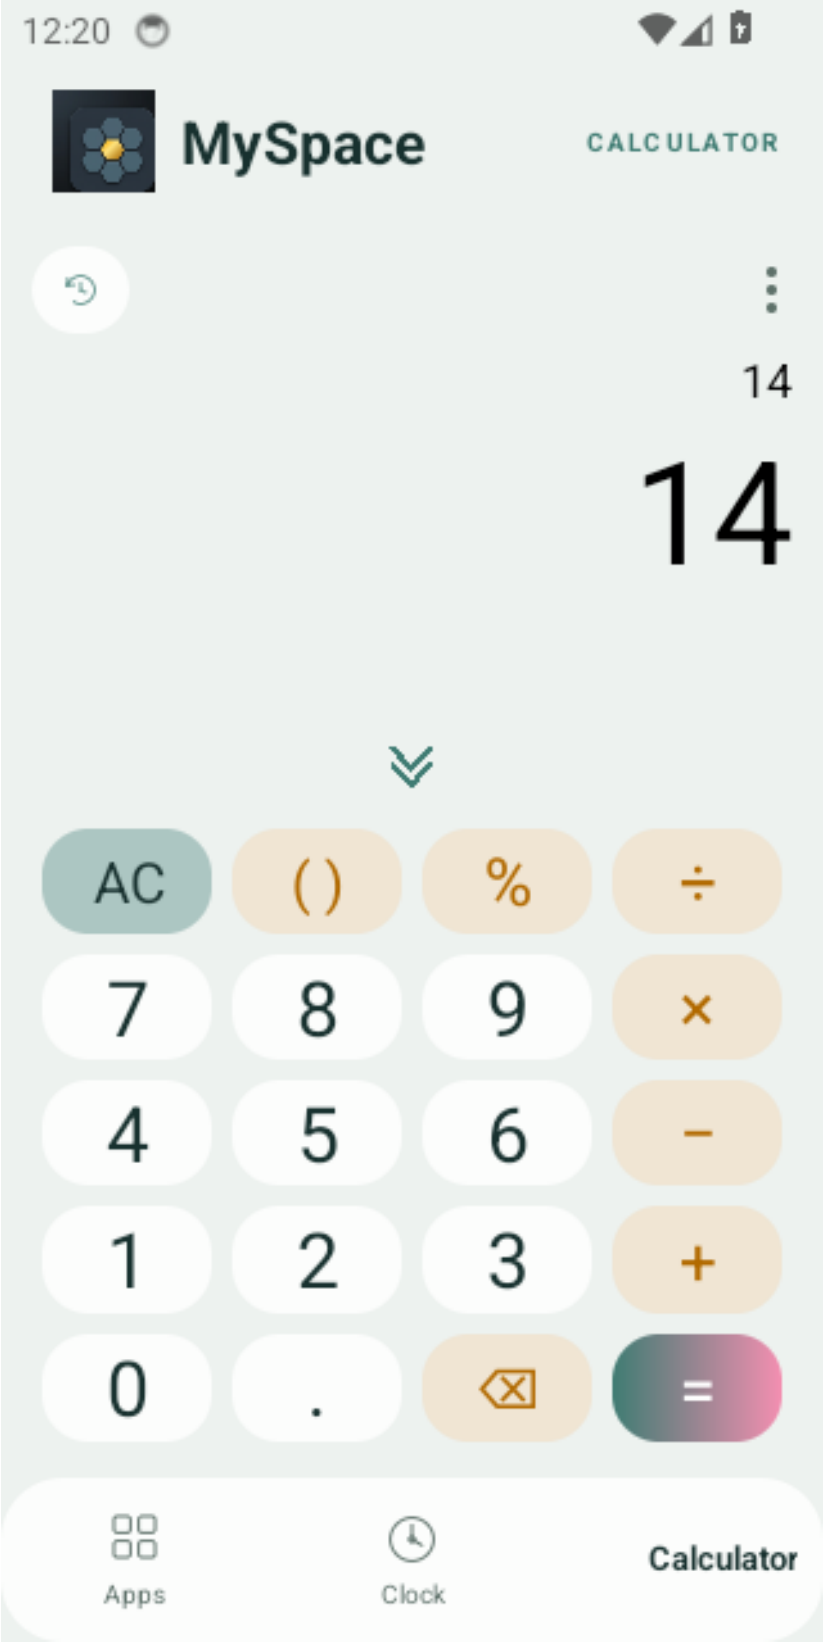

The source-CI workflows at TicTic commit 4f47a46d18a172b7ea44e8f180e5a6035a1cc54d passed; those are kept separate from direct artifact runtime results.

Appendix A — original runtime screenshots

These PNGs were extracted from the uploaded evidence artifacts of run 40321408355. Images are included at native aspect ratio; no UI elements were composited or reconstructed. Each image's SHA-256 is printed under it and the same PNG is published beside this PDF.

Status definitions

PASS means a direct APK assertion was observed. FAIL means the direct assertion was contradicted. BLOCKED means a required comparison/precondition was unavailable. UNCONFIRMED means a case was selected but no usable per-case result was available in retained annotations; it is not silently counted as a pass. SOURCE-CI means the upstream source workflow passed, not that the distributed APK passed that item.

Workflow and artifact index: https://github.com/tarungittarun/AIA-/actions/runs/40321408355
